## Unit 6: Media Lesson

### Section 6.1: Connect the Dots?

#### General Notes

- If you are given a table of data, you can only plot those specific values (without connecting them), unless the context defines a *pattern or rate of change* that can be used to accurately define values in between the given data values.
- In the media, graphs are often presented as a solid line in order to show a general trend or to make the graph look more appealing. However, not all of the points on the line may make sense in the given situation.

**Example 1:** Match the stories with the graphs below, and label the axes accordingly.

Story A: Andy is selling snow cones for \$3 each. This graph shows the revenue earned from selling the snow cones.

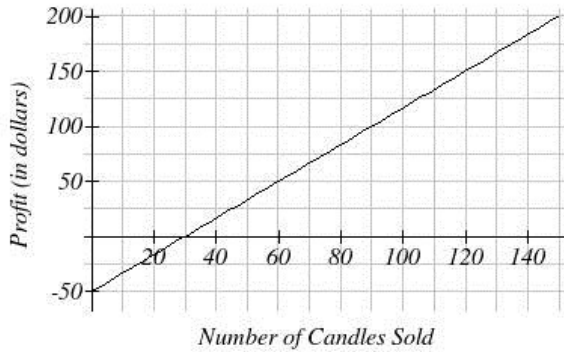

Story B: Andrea is saving money for a trip to Disneyland. Every payday, she sets aside \$100 for the trip. She gets paid every two weeks. This graph shows the amount of money saved over time.

Story C: Andrew is walking to school. There are no streets to cross, so he is able to walk at a constant rate. This graph shows Andrew's distance from home over time.

**Example 2:** Consider the graph below. Do all of the points on the graph make sense in the given situation?

### Section 6.1 – You Try

Match the stories with the graphs below, and label the axes accordingly.

Story A. Water is being drained from a tub. This graph shows the amount of water remaining in the tub (in gallons) after  $m$  minutes.

Story B. Each ride at a carnival costs \$2. This graph shows the amount of money Henry has left over after riding  $x$  rides.

Story C. An electronics store is offering payment plans with 0% interest. Isabel purchases a laptop and pays \$250 on the first of every month to pay it off. This graph represents the remaining balance after  $m$  months.

4. The maximum heart rate is the highest heart rate achieved during maximal exercise. In general, you get the most benefits and reduce the risks when you exercise near your *target* heart rate. Usually this is when your exercise heart rate (pulse) is about 80% percent of your maximum heart rate. For adults 19 years of age and older, the formula  $T = 176 - 0.8a$ , gives the target heart rate,  $T$ , in beats per minute, for a person who is  $a$  years of age.
